

How we make your scented candles

Candles have a special place in the home and British Made candles are the preferred choice for most households. A quality product and value for money are essentials.

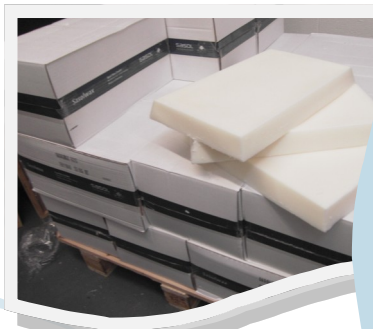

Here we see the process of a small British manufacturer making hand-poured scented candle tins.

Wax is melted in a large vat. The operating temperature is 70°C.

A small quantity of wax is poured into the base of the candle tin and a slug & wick set into the wax. The slug ensures the wick stays central throughout the burn.

Fragrances and coloured dye are then added to the wax.

The candle is now ready for labelling and shipping to a gift shop near you.

Half a Tonne of Wax in 5kg slabs

5kg slab of wax being Inserted into the vat

Tins with a slug and wick to ensure wick stays central

Scented wax being poured into candle tin

Almost Complete

Candle tins labelled and ready for sale

British candles all over the world.
